

Kiwifruit dashboard tools

- 🌀 A single web-based software platform but three dashboard tools i.e.
 - Orchard
 - Postharvest (packhouse/coolstore)
 - Zespri (for industry-level reporting and based on data provided by the orchard and postharvest tools)
- 🌀 All following Screenshots are from the Demo site, using only dummy data.

Orchard dashboard

Home page

Consists of 3 main sections i.e. Home page, Data Entry and Reports

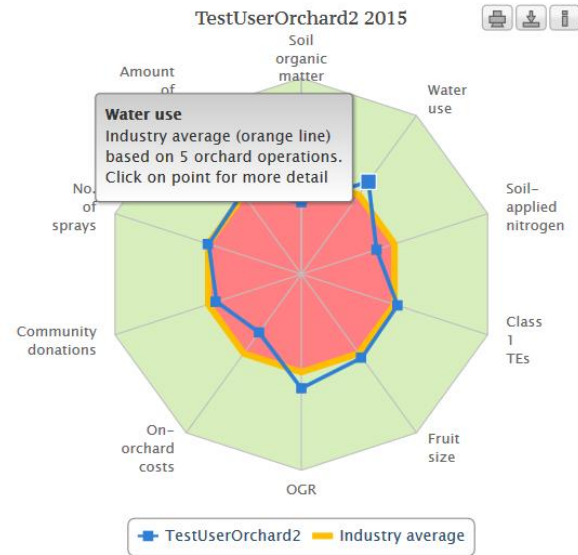

Welcome to the Kiwifruit Sustainability Dashboard

This tool will allow you to monitor, report and benchmark key performance indicators relating to sustainability.

It is being developed as part of the [New Zealand Sustainability Dashboard project](#), funded by MBIE and supported by a number of kiwifruit partners (shown below).

Click [here](#) for notes on entering data in the data entry section.

The home page describes the tool and presents a snapshot of the results for the user in the form of a spider chart (see page 7 for how to interpret this)

Feedback button available

Industry partners

Data entry

A user can enter and view data for multiple orchards

Total

>

By default high level info is requested.

Users have the option to enter more detail, for individual varieties, by clicking the arrows (i.e. ">") next to the 'Total' labels.

Data entry is organised by sustainability pillar and outcomes / objectives

Include buildings & plant, dwelling, drains, fence & vine supports, tracks, water supply, protective clothing, low cost assets

Reports

Reports

Chart interpretation

Orange line in the middle is average of all orchards (that data has been entered for). Blue points are the average values for the orchards associated with the user that is logged in. If these points are outside the orange line in the green zone then their result is better than average; vice versa if inside the orange line in the red zone

Clicking on the blue points leads to more detailed results including for individual orchards and varieties (see example on next page).

Hovering over the blue points reveals additional context i.e. the number of orchard operations that the average is based on.

A major objective of the dashboard tools is to use existing industry data to minimise data entry burden.

Here, the results shown are based on Zespri spray diary data that has been automatically imported – this data was previously entered by users as part of their normal orchard management requirements.

Reports

Reporting menu allows benchmarking to be customised e.g. for a particular orchard, variety, region etc. By default, the results reported initially are the averages of all factors e.g. all varieties.

Hovering over the orange points reveals additional context i.e. number of orchard operations that the average is based on.

Postharvest dashboard

Home page

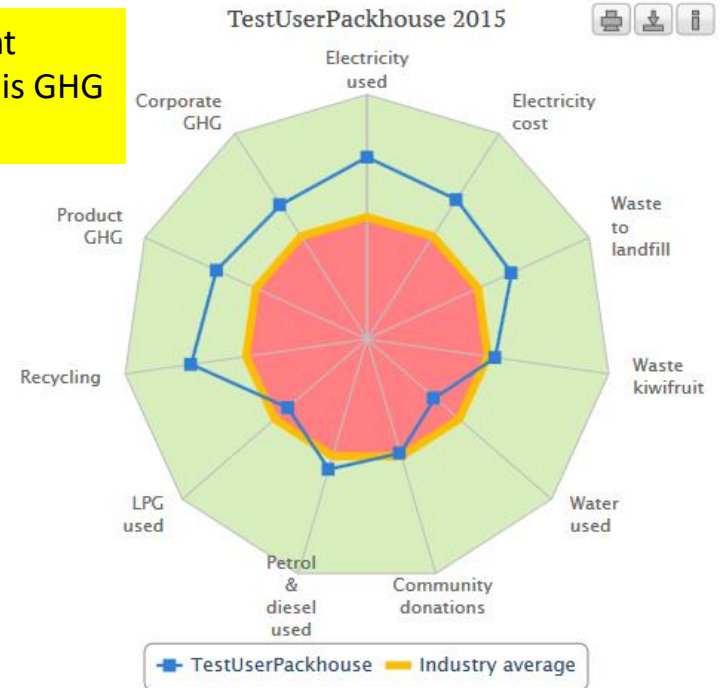

Welcome to the Kiwifruit Sustainability Dashboard

This tool will allow you to monitor, report and benchmark key performance indicators relating to sustainability.

It is being developed as part of the [New Zealand Sustainability Dashboard project](#), funded by MBIE and supported by a number of kiwifruit partners (shown below).

A major recent development is GHG reporting

Design & functionality similar to orchard dashboard however content differs reflecting the inherently different systems.

Data entry

As with the orchard version, a user can enter or view data for multiple postharvest sites.

In this example, total GHG is shown but an individual component (e.g. fuel use) can also be reported.

Zespri dashboard

Home page

Testing site

HomeReportsZespriLogout

Welcome to the Kiwifruit Sustainability Dashboard

This tool allows Zespri to generate reports on key performance indicators relating to sustainability.

Industry averages, based on data directly entered by growers and postharvest operators, are currently available for the following:

- **Orchards** - Financial (OGR, expenses), production, environmental (spray use, soil quality, water use, soil-applied N) and social (community support)
- **Postharvest** - Financial (electricity cost), environmental (electricity use, waste and fuel consumption) and social (community support)

To start accessing this information, click on the 'Reports' tab above.

This is a prototype, underpinned by orchard and postharvest dashboard tools currently being developed. It will be developed further over the next 2 to 3 years, during which time the design, content and functionality is expected to change significantly based on industry feedback.

The NZ Sustainability Dashboard tools are being developed as part of the [New Zealand Sustainability Dashboard project](#), funded by MBIE and supported by a number of kiwifruit partners (shown below).

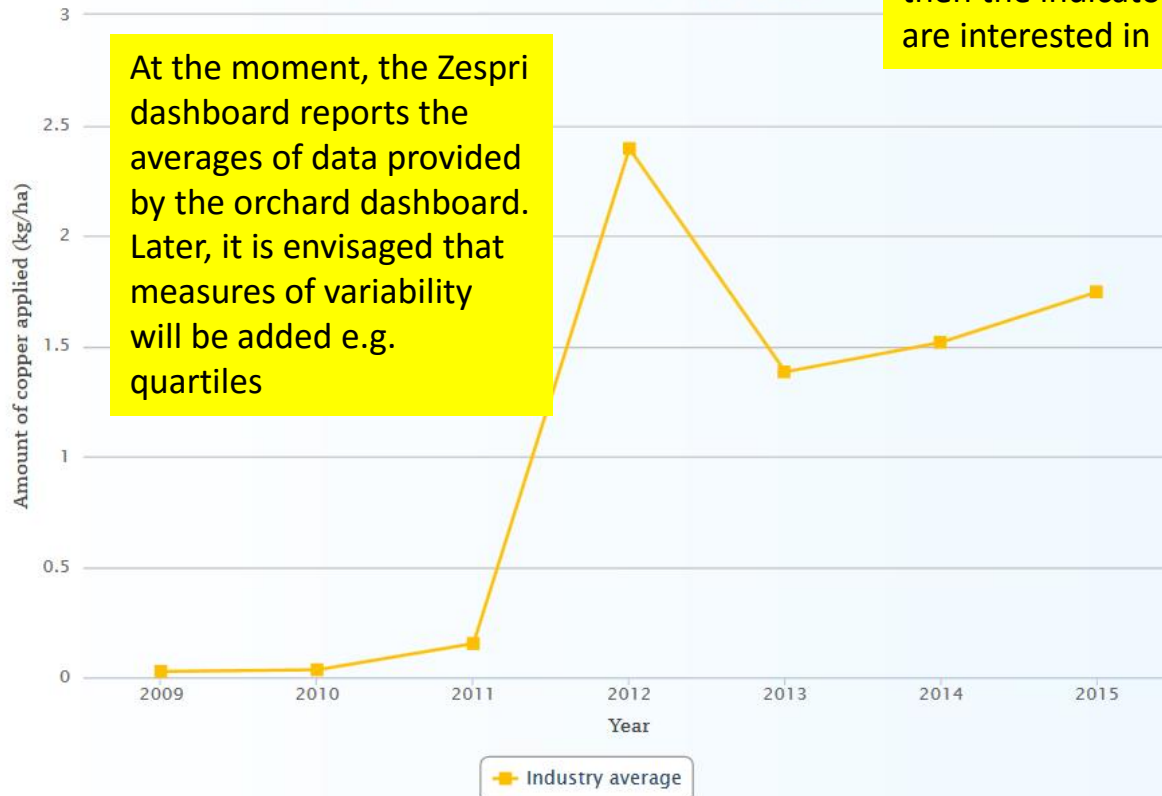

A major difference between the Zespri dashboard and the others is there is no 'Data entry' section as reporting here is based on data provided by the orchard and postharvest dashboards which are linked.
